1 Production Pathway and Fuel Quality
Introduction Global Bioenergies and SkyNRG

Global Bioenergies

EU-based SME founded in 2008 (public company on Euronext)
Around 60 persons operational
Coordinator of EU H2020 Project REWOFUEL

SkyNRG

EU-based SME founded in 2010
Around 30 persons
Partner in EU project REWOFUEL

This project has received funding from the European Union’s Horizon 2020 research and innovation programme under grant agreement No 792104. This publication reflects the views only of the author, and the INEA cannot be held responsible for any use which may be made of the information contained therein.

Conversion of renewable resources into hydrocarbons through fermentation
Laboratory facilities and pilot plant in France (8 gallons per day)
Fermentation demo plant in Germany (50 gallons IBN per day)

2012
R&D in Evry, France

2015
Fermentation pilot plant in Pomacle, France

2017
Fermentation demo plant in Leuna, Germany

2020
Conversion pilot plant in Lyon, France

Commercial Plant (>30,000 gallons/day)
GBE’s technology ferments sugars into isobutene (IBN) and upgrades the IBN into SAF

Raw feedstock for fermentation is sugar
Sugar can be derived from sugar crops (sugar beet, sugar cane) or 2nd generation feedstock such as wood and agri residues.
In project REWOFUEL the sugars are specifically obtained from residual wood hydrolysate

</table>
Both Gevo and GBE use sugars as a feedstock for fermentation.

Gevo’s fermentation yields isobutanol. Isobutanol is converted into isobutene via dehydration, and upgraded to SAF.

GBE’s fermentation directly yields Isobutene, which is upgraded to SAF via the same process as Gevo.

Both GBE’s and Gevo’s SAF are rich in C12 and C16 hydrocarbons, fully iso-paraffinic.

Gevo’s pathway is ASTM approved in D7566 Annex 5, GBE seeks ASTM approval via inclusion in D7566 Annex 5.

- Extension of existing annexes preferred over adding new ones
- Fuel composition is very similar to Gevo’s ATJ-APK, and less to conventional jet fuel, therefore seeking Fast Track approval is not preferred.
Neat GBE SAF samples closely resemble Gevo’s HC composition and distillation profile

Sample preparations:

*GBE’s Isobutene and oligomers*
Several tons of Isobutene produced in lab, pilot and demo. Over a ton of oligomers produced via lab and pilot

*GBE’s SAF*
Multiple samples prepared at Laboratory Scale: GBE-0, GBE-1 and GBE-1b

Approx. 30 Liters of SAF is produced in 3 campaigns via laboratory set-up, all samples are used in ASTM approval process

Hydrocarbon (HC) analysis results:
Hydrocarbon composition reveals 99,71 wt% iso-paraffins
Approximately 82% iC12 and 15% iC16

Gevo: approximately 83% iC12 and 14% iC16

Resulting in a highly similar distillation profiles for GBE’s SAF and Gevo’s ATJ-SPK

![D86 Distillation Profile Neat SPKs](chart)
GBE’s SAF in line with D7566 Annex 5 ATJ-SPK batch requirements

Chemical Analysis of SAF Samples suggest close resemblance to Gevo’s ATJ-SPK

All parameters within Annex 5 specification limit.

Except hydrogen & carbon mass. This was due to faulty measurements. D5291 is a very sensitive method.

Re-testing of the sample via Clearing House yields satisfying result. Slightly on the low side. Possibly caused by anti-oxidant addition.

GBE’s SAF blended with Jet A1 performs within specifications of D7566 Table 1

- GBE blends produced from GBE-0 and analysed
  - 50/50% blend with Jet A1,
  - 30/70% blend with Jet A1

All requirements for aviation turbine fuels containing synthetic hydrocarbons according to D7566 Table 1 are met, with a small exception in the distillation profile of the 50/50% blend.

Distillation profile of Gevo’s ATJ-SPK blend has similar slope. Extensive combustion testing of Gevo ATJ fuel showed no issues with combustion.

GBE-0 is the first GBE SAF sample produced in laboratory, newer samples have slightly optimized distillation profile and are expected to perform within fuel requirement limits.

More blends containing GBE’s SAF will be produced and analysed to confirm meeting D7566 Table 1 specifications.
Other parameters of lab scale blends also ‘on-spec’ – pilot samples will be analyzed soon

**Next stage SAF samples:**

Currently conversion pilot facility is operational in Lyon, which has produced over 250 litres of hydrocarbons in multiple runs.

Large SAF samples (>100L) reserved for ASTM testing expected this and next month.

Three SAF batches will be available to confirm product quality consistency throughout pilot production.

One pilot batch will be used to validate that GBE’s SAF meets all requirements for ATJ-SPKs, essential for ASTM approval.
2 ASTM Qualification Process
Fuel Specifications Properties analysed for GBE’s SAF

Key Tier 2 parameters analysed: Hydrocarbon Composition, Trace Materials and Boiling Point Distribution

Almost all parameters within D7566 specification limits (exceptions discussed previously)
No trace materials present.

Next steps:
November 2020, pilot batches of GBE SAF available (> 100L)
- Three batches to demonstrate pilot production consistency
- One batch will be used to demonstrate D4054 Table 2 Fit-For-Purpose Properties
- All Tier 1 and Tier 2 tests will be performed on this pilot sample.

Tier 1 and Tier 2 testing expected to be finalized Q2 2021. These results will complete the Phase 1 Research Report. The report will be written by SkyNRG in conjunction with Global Bioenergies and the D4054 Clearinghouse.
Timeline: OEM review of Phase 1 Research Report expected end Q2 2021

- Testing laboratory SAF batches to confirm similarity with Gevo’s ATJ-SPK
- Commissioning of REWOFUEL conversion pilot facility in Lyon, France
- Set up ASTM Collaboration Area

2020

- Chemical analysis of laboratory SAF batches
- ASTM Work Item registered (WK71952)

2021

- Continuation FFP testing of neat and blend batches
- Aim to submit Research Report for OEM review

- Access to large volumes of SAF produced in pilot facility
- Tier 1 testing of pilot batches in 3-fold
- Tier 1 testing of 50% blend pilot batch with conventional Jet A1
- Tier 2 (FFP) testing of neat and blended batches from pilot facility (1-fold)
Experience and Tips for seeking ASTM approval
So far, very positive experience in the ASTM approval process

<table>
<thead>
<tr>
<th>Experience</th>
<th>Tips</th>
</tr>
</thead>
<tbody>
<tr>
<td>There is a tremendous amount of knowledge and experience available at ASTM outside of publications</td>
<td>Make sure to invest in personal contact with FAA, Clearing House and OEMs to fully understand the approval process</td>
</tr>
<tr>
<td>Bi-annual ASTM meetings (and other fuel quality conferences) in person allow for more detailed and informal discussions with OEMs, other candidate fuel producers and ASTM committee members. Much more challenging via virtual meetings.</td>
<td>Start engagement with stakeholders timely</td>
</tr>
<tr>
<td>Guidance by FAA and Clearing House essential and very helpful</td>
<td>Take the opportunities to present at ASTM and OEM meetings to communicate progress and obtain feedback.</td>
</tr>
<tr>
<td>Chemical analysis results are not always straightforward, consistent or realistic.</td>
<td>Make sure task force members are aware of any challenges timely.</td>
</tr>
<tr>
<td>Delays are unavoidable</td>
<td>Try to schedule frequent discussions with members of your task force now that there are no more easy discussion opportunities during conferences.</td>
</tr>
<tr>
<td></td>
<td>Keep a strict sample administration and record all changes. Chemical analysis will reveal any small change.</td>
</tr>
